

2. Industry Overview

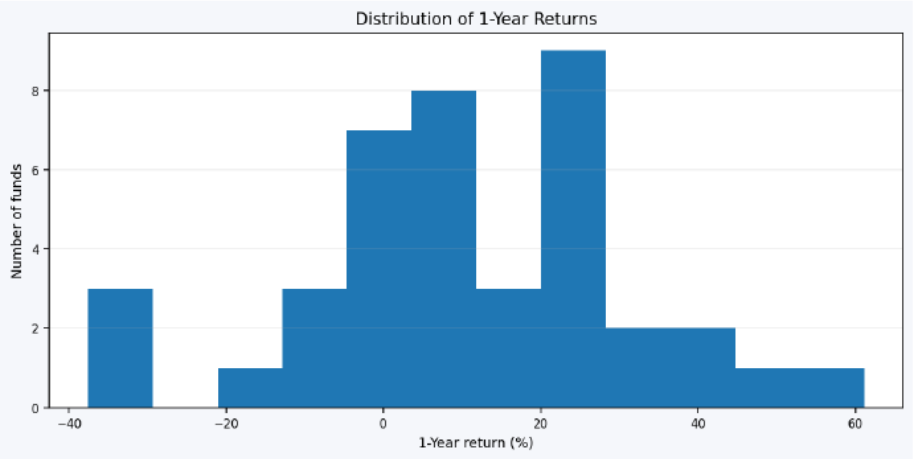

The modeled AUM series provides a quarterly view of industry scale. The chart is based on the sum of scheme-level AUM records available in the database.

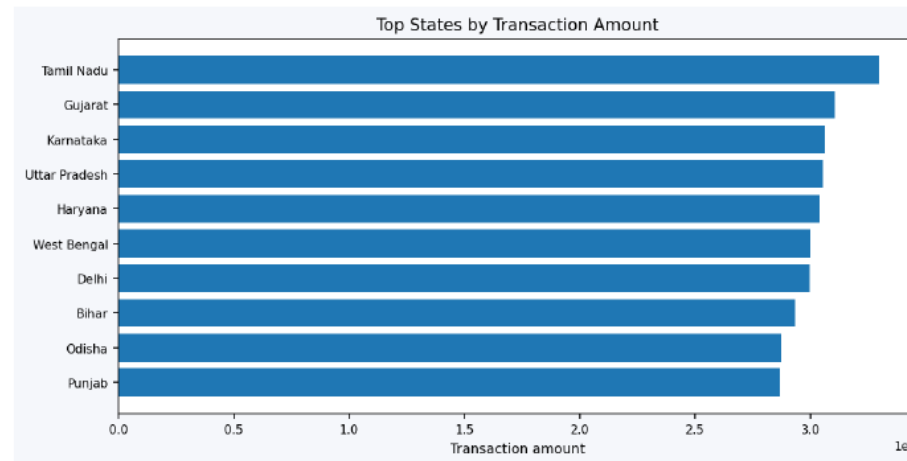

3. Fund Performance & Risk

Across the 40 modeled schemes, the average 1-year return is 10.31% and average standard deviation is 20.02%. The average Sharpe ratio is -0.14. These averages hide substantial scheme-level dispersion, reinforcing the need for risk-adjusted comparisons.

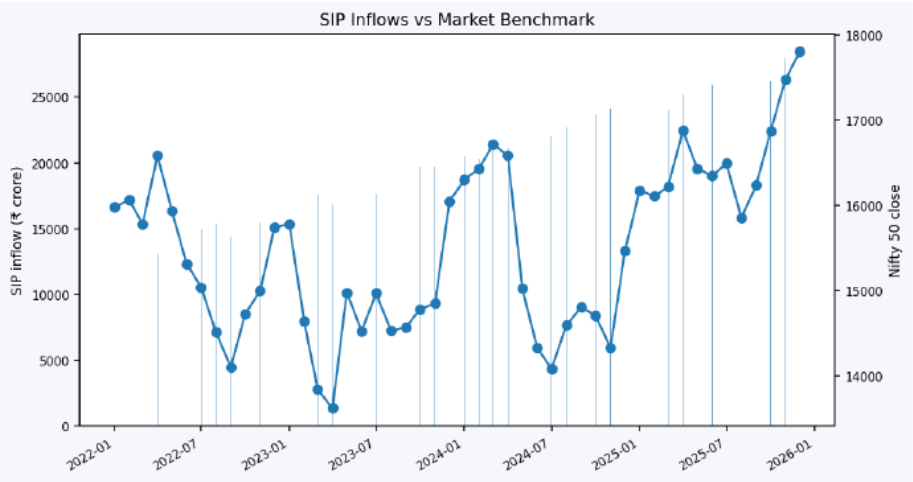

5. Investor Analytics

The transaction dataset contains 5,000 unique investors and 35,039 transactions. Total modeled transaction value is **441,318,000**. State, age, city tier and transaction type are available for segmentation and are exposed in the Streamlit analytics layer.

4. SIP & Market Trends

SIP inflow is plotted alongside the selected benchmark index to support an industry-versus-market view. The dual-series chart is descriptive; it should not be interpreted as evidence that market movements causally drive SIP contributions.
